

# HYDRANT FLUSHING SCHEDULE 8-31-2021

Plant is currently able to produce 340,000 Gallon per day.

Current Consumption is averaging 240,000 Gallon per day

That leaves the city with approximately 100,000 Gallon per day surplus to flush hydrants with.

To flush the average Fire Hydrant the flow would be approximately 500 Gallon per minute.

To achieve a through flush the average Fire Hydrant will need to be flushed 30 minutes.

Some maybe more some may be less.

At this rate each hydrant could use 15,000 gallons. Take our surplus of 100,00 gallons per day divided by 15,000 per hydrant equals approximately 6 hydrants per day that the city will be able to flush.

Our current schedule could allow us to flush as many as six a day, but this would be subject to change based on our workload.

Following is a day-by-day breakdown of the flushing schedule.

## Day one

Flush Hydrant at south tower.

Then Hydrant at lot #4 on Buckles Grove Road.

Then Hydrant at intersection of Bicentennial drive and South East Street at lot #1.
